

Once class L'i ele glatim class L vs all: X2 digerleri regative class, A he (x) assign educer ve heo gaptigimai gapions ve mesela selvildeli gibi bir decision bondary elde edecegis. Souvoi Class 2 icin: Yeni bir legistic regressien dassilven ho (x) fit edent. Soma Class 3 van: ho(3) (x) > We have fit three classifiers for i=1,2,3. ho (x) = P(y=1 (x) 0) (1=1,2,3) You how (x): gnilon x dalası icin ve o la icin y=1 olma olasiligini veriyon, Digerleri de ayn) selilde y=2 ve y=3 olma olasiligini veriyor. One-us-All: Train a logistic regression classifier holl(x) for each class i to predict the probability that y=1. On a new input x, to make a prediction, proce the class P that maximizes max he (x) Macingo youleh olasililly segens

w3 - Advanced Offinitation Algorithms

Denlan kullananak logistic negression in GDA ile colidaha hirli sahsmasini ve large scale problemlere nahat vygvlorabilmesini ragilars.

- CDA nin difinda baftia optimisation algorithms de voi:

- · Conjugate gradient
- L-BF65

+ No need to manually pick & often faster than gradient descent

- More complex

Example:

$$J(\theta) = (\theta_1 - 2)^2 + (\theta_2 - 2)^2$$

302

Let's apply an advanced opt. algorithm to minimize JCO1:

function ExVal, gradient I = cost function (theta)

gradient = zeros (2,1); gradient (11 = 2* (theta(11-5);

gradient(2) = 2* (theta(2)-5);

NOW we can call adv. opt. function:

options = optimset ('Bradobj', 'on', 'Max Iten', 'LOO');
initial Thela = zenos (2,1);

[opt-Theta, function Val, exit=lag] = fminunc (@cost=unction)

Once ust taraftahi functionia end eble costfunction ismi ile baydet!

Sonna asagidahi busmi basha mfile or you \$100' yenne in L is Lyon
divelet 100 you. help friende da yordina olabilir.

Sunucla Logistic Regression için:

theta = Po thela (1)
theta = thela (2)
Thela (n+1)

function It Val, gradient] = cost Function (thela)

JVal = I code to compute J(A)]

gradient(1) = I code lo comple 300 I(0)]

Scapable With +11= t code la comple 3 TO)]

Sonra finincial kullanun ve optimmed the sa values will be obtained.

Ideal Can lan

Ideal for large scale (too many features) problems
